

tts digital adoption solutions to Showcase 2026 Release at Banking Transformation Summit Europe in London

London, 19 May 2026 — tts digital adoption solutions will showcase its newest 2026 release at **Banking Transformation Summit Europe**, taking place **19–20 May 2026 at Tobacco Dock, London**, where senior banking leaders will gather to explore the technologies, capabilities, and cultural shifts reshaping financial services.

With banks accelerating investment in AI, core system modernization, customer experience, and operational resilience, tts will demonstrate how a digital adoption platform helps ensure new technologies are not only deployed, but used correctly, confidently, and consistently across the business.

The 2026 release of the tts performance suite advances how banks manage, access, scale, and govern knowledge across complex enterprise environments. New capabilities include faster knowledge discovery through vector search, smarter use of structured, quality-assured content with generative AI and Microsoft Copilot, server-side analytics for more effective knowledge governance, AI-powered e-learning creation from existing content, and a more consistent experience across QuickAccess and WebAccess. For banking teams, this means knowledge can be easier to find, simpler to apply, faster to distribute, and better governed—supporting employees directly in the workflow, where accuracy, compliance, and execution matter most

“Guidance in every workflow because banking can’t afford guesswork.” That message will be central to the tts showcase, highlighting the value of embedding digital adoption into everyday banking processes—from onboarding and servicing to compliance-led workflows and system change.

Attendees will see how tts digital adoption solutions can help banks turn technology investment into measurable adoption by giving employees contextual support across the systems they use every day.

About tts digital adoption solutions

tts digital adoption solutions help organizations improve software adoption, process execution, and workforce productivity through contextual guidance, learning, and performance support embedded directly into the flow of work.
